

It would be most helpful for law enforcement if records were made available regarding all aspects of our lives. However, not all instances would be cost effective for the government, and we have already been troubled enough with the unbridled growth of government and the Code of Federal Regulations.

That we have the technology to meet the requirements of this proposal is not sufficient reason to implement it. Otherwise, it would be consistent if the proposal included that all transmitters be outfitted with circuitry that would produce individually identifiable transmission artifacts, whose qualities are maintained in government databases, so the radio owner or operator may be instantly identified by their transmissions.

There are all sorts of technological answers that may be thrown at the problem of prohibited transmissions.

I believe it would be more cost effective to continue using present technologies and methods as required in case of prohibited transmissions, instead of requiring the generation of what would be essentially a national database that would consist almost entirely of properly utilized equipment and their owners.

I would support an increase in funding for the FCC's field enforcement and other enforcement activities, which are directed towards finding specific violators, rather than towards the entire radio-employing population. I would support the purchase and upgrading of any equipment required by the FCC to further its enforcement efforts within the philosophy under which it has already been operating.

Thank you for receiving my opinion.
